Introduction

This project aims to build a _preliminary_ recommendation system for hotel site selection in Hong Kong, which will provide the real estate companies with basic ideas about where to build a new hotel and which class of hotel is better.

When choosing the hotel location, the land price and construction cost must be considered. However, due to complexity of these data, they will be excluded from the analysis.

The project will only focus on _surrounding venues_ such as restaurants, parks, shopping malls and other points of interest.
